

Week 1

# The Structure of Websites

# Announcements

- If you haven't already:
  - create your account on **WDD Portal** ([wdd.io](https://wdd.io)) by tonight
  - join this class on [Piazza](#)
  - enroll in CS 198 on **CalCentral**
- Homework 1 will be announced on Piazza, due **next Tuesday, 7:00 PM**
- Post your question on [wdd.io/queue](https://wdd.io/queue) if you're shy to ask
- Please download a text editor ([Visual Studio Code](#)) and [Google Chrome](#) for this class
- If you're DSP, please let us know so we can accomodate

# Creative tools

## Web Browser

Chrome

Safari

Firefox

Opera

Edge

## Code Editor

Visual Studio Code

Atom

Brackets

Sublime

## Prototyping

Figma

Adobe XD

Sketch

Illustrator

Basic HTML tags

File Paths

# What is a website?

A **website** is traditionally a set of web pages served on a single domain

A **web page** is a document, usually written in HTML

A **domain** is an address (wdd.io) that represents a server where the files are located

"Fire station"

Look up the address

Render code on canvas

Web Design DeCal Fall 2020

# Two ends of a website (*roughly speaking*)

## Front end

What users can see &  
what happens in your web browser  
e.g. text, images, buttons

## Back end

What users can't see &  
beyond your web browser  
e.g. databases

# What websites are made of

HTML

Structure

CSS

Design

JavaScript

Function

## **HTML provides the structure of the page**

HTML files defines the content on the page, like text, links, and images

HTML = Hypertext Markup Language

```
<div id="nav" class="nav-active-cover">
  <div id="nav-progress"></div>
  <div id="nav-spine"></div>
  <div id="nav-content">
    <div id="nav-item-cover" class="nav-item nav-item-active">Home</div>
    <div id="nav-item-about" class="nav-item">About</div>
    <div id="nav-item-curriculum" class="nav-item">Curriculum</div>
    <div id="nav-item-schedule" class="nav-item">Schedule</div>
    <div id="nav-item-instructor" class="nav-item">Instructors</div>
    <div id="nav-item-faq" class="nav-item">FAQ</div>
  </div>
  <div class="clear"></div>
</div>
<div id="guide">
  <div id="guide-caption">Scroll to learn more</div>
  <div id="guide-icon"></div>
</div>
```

**CSS provides the design of the page**

CSS files define rules for the appearance of content

CSS = Cascading Stylesheets

```
body {  
  margin: 0;  
  font-family: 'Lato', sans-serif;  
  background: #f7f5f2;  
  -webkit-font-smoothing: antialiased;  
}  
  
a {  
  color: inherit;  
  text-decoration: none;  
}  
  
.img-scaled {  
  width: 100%;  
}  
  
.img-scaled-wh {  
  width: 100%;  
  height: 100%;  
  object-fit: cover;  
}  
  
.clear {  
  clear: both;
```

## JavaScript provides the function of the page

Examples: dropdown menus, tabs, anything where something on the webpage reacts to human interaction

```

function resize_dom(window_height) {
    $('.schedule-item')
        .css('padding-top', (($(window).height() - window_height) / 2) + 'px');
    $('.schedule-item:nth-child(12)')
        .css('padding-bottom', (($(window).height() - window_height) / 2) + 'px');
    $('#apply-header').css('height', $(window).height() - 180 + 'px');

    setTimeout(function(){
        scheduleOffsetDict = {};
        $('.schedule-item').each(function(i){
            scheduleOffsetDict[$(this).position().top - 120] = i;
        });
    }, 100);
}

function set_cover() {
    var offsetY = $(window).height() * 0.7 - 340;
    $('.window-container').css('top', offsetY);
}

$(document).ready(function(){
    set_cover();

```

Name	Date	Type ^	Size	Tags

Example website folder - the html files are each webpage, the css file contains the stylesheet, the js files contain JavaScript, and the image files also need to be present to be displayed on the pages

Structure of Websites

**Structure of a Single Webpage**

Structure of Content in the Webpage

Basic HTML tags

File Paths

# What websites are made of

HTML

Structure

CSS

Design

JavaScript

Function

# An HTML file

- A plain text file with the file extension .html
  - **index.html** is the starting point / homepage of a website
- Edit with text editors (Sublime, Atom, etc)
- Open in web browser to see result!
- A collection of **tags** related to each other in **parent-child relationships**

# Tags

`<strong>text will be bold</strong>`

Opening tag

Closing tag (always  
has slash!)

Tags are the building blocks of HTML  
And they *usually* come in pairs

# Anatomy of an HTML Document

```
<!doctype html>
<html>
  <head>
    <title>Welcome Page</title>
  </head>
  <body>
    <!-- your webpage content
         goes inside the body tag -->
    <p>Welcome to WDD!</p>
    
  </body>
</html>
```

(size may vary on your screen, but that's ok!)

# Anatomy of an HTML Document: **doctype**

```
<!doctype html>
```

Tells the browser  
that this file  
contains HTML!

```
<html>
```

```
<head>
```

```
<title>Welcome Page</title>
```

```
</head>
```

```
<body>
```

```
<!-- your webpage content  
goes inside the body tag -->
```

```
<p>Welcome to WDD!</p>
```

```

```

```
</body>
```

```
</html>
```

(size may vary on your screen, but that's ok!)

# Anatomy of an HTML Document: `<html>`

```
<!doctype html>
```

```
<html>
```

```
<head>
```

```
<title>Welcome Page</title>
```

```
</head>
```

```
<body>
```

```
<!-- your webpage content  
goes inside the body tag -->
```

```
<p>Welcome to WDD!</p>
```

```

```

```
</body>
```

```
</html>
```

Pair of `<html>` tags,  
where everything  
will go inside

(size may vary on your screen, but that's ok!)

# Anatomy of an HTML Document: `<head>`

```
<!doctype html>
<html>
  <head>
    <title>Welcome Page</title>
  </head>
  <body>
    <!-- your webpage content
         goes inside the body tag -->
    <p>Welcome to WDD!</p>
    
  </body>
</html>
```

`<head>` contains other info for the browser - later this is where we'll specify CSS and JS files.

Anything in `<head>` will **not** be displayed on the page!

(size may vary on your screen, but that's ok!)

# Anatomy of an HTML Document: `<title>`

```
<!doctype html>
<html>
  <head>
    <title>Welcome Page</title>
  </head>
  <body>
    <!-- your webpage content
         goes inside the body tag -->
    <p>Welcome to WDD!</p>
    
  </body>
</html>
```

`<title>` tag specifies the text that shows on the tab of a web browser, at the top of the window, on a Google search result.

(size may vary on your screen, but that's ok!)

# Anatomy of an HTML Document: `<body>`

```
<!doctype html>
<html>
  <head>
    <title>Welcome Page</title>
  </head>
  <body>
    <!-- your webpage content
         goes inside the body tag -->
    <p>Welcome to WDD!</p>
    
  </body>
</html>
```

(size may vary on your screen, but that's ok!)

Everything inside `<body>` is what will show up on your page!

Structure of Websites

Structure of a Single Webpage

**Structure of Content in the Webpage**

Basic HTML tags

File Paths

# Anatomy of an HTML Document

```
<!doctype html>
<html>
  <head>
    <title>Welcome Page</title>
  </head>
  <body>
    <!-- your webpage content
         goes inside the body tag -->
    <p>Welcome to WDD!</p>
    
  </body>
</html>
```

(size may vary on your screen, but that's ok!)

# Anatomy of an HTML Document

```
<!doctype html>
<html>
  <head>
    <title>Welcome Page</title>
  </head>
  <body>
    <!-- your webpage content
         goes inside the body tag -->
    <p>Welcome to WDD!</p>
    
  </body>
</html>
```

(size may vary on your screen, but that's ok!)

# Anatomy of an HTML Document: `<!-- comments -->`

```
<!doctype html>
<html>
  <head>
    <title>Welcome Page</title>
  </head>
  <body>
    <!-- your webpage content
         goes inside the body tag -->
    <p>Welcome to WDD!</p>
    
  </body>
</html>
```

(size may vary on your screen, but that's ok!)

Lines that look like this:  
`<!-- comment -->`  
are completely ignored by the browser and do not show up on the webpage, but they're super useful to make notes to yourself or others!

Questions?

Structure of Websites

Structure of A Single Webpage

Structure of Content in the Webpage

**Basic HTML tags**

File Paths

# Basic forms of content in a document

- Paragraph text
  - bold, italic
- Headings
- Links
- Lists
- Images

## Text

`<p>paragraph of text</p>`

`<p>second paragraph of text</p>`

Put text on different lines via paragraph tags

p = paragraph

## Bold and italic text

`<strong>bold text</strong>` 

**bold text**

`<em>italic text</em>` 

*italic text*

em = emphasized

## Nesting tags

`<strong><em>different</em> text</strong>`

***different text***

# Headings

`<h1>Big bold heading</h1>`

`<h2>Smaller bold heading</h2>`

`...`

`<h6>Smallest bold heading</h6>`

**Big bold heading**

**Smaller bold heading**

...

**Smallest bold heading**

# Links

```
<a href="https://example.com">Click here</a>
```

url

clickable text

# Lists

```
<ul>  
  <li>apples</li>  
  <li>oranges</li>  
  <li>bananas</li>  
</ul>
```

- apples
- oranges
- bananas

- ul = **u**nordered list
- li = **l**ist **i**tem

# Images

- **EXCEPTION:** only one tag, not a pair! Has a slash *at the end*.
- src = source (where should the web browser go to find the image?)

For your own images:

```

```

For an image somewhere else on the internet:

```

```

## Another nesting example

```
<a href="https://wdd.io">  
      
</a>
```

What's the result here?

Questions?

A lot of the tags seem very specific  
What about a "*generic*" tag to structure the content?

# What tags can we spot here?

```
<!doctype html>
<html>
  <head></head>
  <body>
    <h1>Department store</h1>
    <div>
      <h2>Fruit</h2>
      <p>We have apples, oranges, pears, etc.</p>
    </div>
    <div>
      <h2>Coffee</h2>
      <p>There is cold brew, decaf, ???</p>
    </div>
  </body>
</html>
```

# What is a div tag?

- An empty, meaningless box!
- "Divides" up page content for better structure – grouping things

```
<!doctype html>
<html>
  <head></head>
  <body>
    <h1>Department store</h1>
    <div>
      <h2>Fruit</h2>
      <p>We have apples, oranges, pears, etc.</p>
    </div>
    <div>
      <h2>Coffee</h2>
      <p>There is cold brew, decaf, ????</p>
    </div>
  </body>
</html>
```

# Summary: HTML for structuring content

- Some tags like `<em>` or `<h1>` come with some visual formatting already
  - These defaults (like Times New Roman) come with the browser, but next week we'll introduce CSS to change the appearance!
- But HTML is not for visual formatting, it's for putting your text and images into **meaningful “chunks”**
  - (which is why `<div>` is so important, even though for now it's just an invisible box)
  - It'll help create layouts later!

Structure of Websites

Structure of A Single Webpage

Structure of Content in the Webpage

Basic HTML tags

**File Paths**

The **most common issue** on the first homework is  
adding images!!

Problem: image does not show up

## The issue:

1. For images and links you need to specify **where the image is**, or **where you want to link to**
2. The image is on your laptop, so you type:  
``
3. The image shows up fine
4. When you submit hw, the image no longer shows up

Why? Our web server has no idea where to find the picture, because the file path is specific to a single laptop!

## Instead..

1. Put the image you want in the same folder as your html file
2. Example file structure:

- hw1/
  - index.html
  - images/
    - doggo.jpg
    - doggo2.jpg

3. Then, think about how to go from index.html to doggo.jpg:

```

```

Now, no matter where you move the hw1/ folder, the path to the image is still correct!

**Also, our web server is case-sensitive!**

`` will **not** work if the image is actually named `doggo.JPG`

# Coding doesn't have to be scary!

- Keep your HTML organized by indenting lines so that you can easily see how opening and closing tags match
- Refresh your webpage often - write one line of HTML, then refresh the browser to see your changes! Work step by step.
- If something doesn't look the way you expect - double check your opening and closing tags, and spelling.

# For your homework

- Homework 1 is released tonight and is due **next Tuesday 7pm**.
- It covers basic syntax of HTML and will guide you through making your first website.
- Find it on WDD Portal!
- Feel free to ask questions on Piazza!

example of a file directory

# VSCode Demo
